

Program Name:

Rock Paper Scissors Game Revised

Purpose:

A reworked version of the given Rock Paper Scissors game provided.

Inputs:

- Entering rock, paper, or scissors for 3 rounds to declare a winner between the user and the bot

Outputs:

- Instructions
- Results after first, second, and third rounds
- Final results at the end/ Declare winner

Variables:

- player_score → int → tracks how many rounds the player has won
- bot_score → int → tracks how many rounds the bot has won
- player_move → string → store the player's input/choice
- bot_pick → string → stores the bot's randomly chosen move
- moves → string → holds the three possible options: "rock, paper, scissors"
- round → int → loop counter for the current round number
- valid → bool → flags down when a player enters a valid move

Key Design Choices:

- Best of 3 concept
 - The for loop stops once the game has someone that reaches 2 wins, rather than playing out all 3 rounds.
- Array based movements
- Using srand(time(0)) to create more random sequences rather than the same each time.

Program Steps:

- 1) Instructions to be read
- 2) Round 1 begins and shows the score as 0-0
- 3) Choose between rock, paper, scissors
- 4) If a choice is invalid → error and asked to type again
- 5) Bot reveals its choice after user
- 6) Result of that round is declared
- 7) If game isn't over yet → enter key to start next round
- 8) Repeat up to 3 rounds → stops early if user or bot hits 2 wins
- 9) Game ends with the final score and displays either "you win!", "bot wins!", or "tie game!"

Sample Input/Output:

- Input:
 - Round 1: User enters rock, paper, or scissors
 - Same for Round 2
 - If needed, same for round 3
- Output:
 - ____ wins!
 - If game ties → Tie game!

Test Cases:

Test #1

- Round 1
 - Player chooses rock
 - Bot randomly picked scissors
 - User 1 - 0 Bot; You win!
- Repeated for next 2 rounds if needed
